#### **DETAILED ACTION**

This Office Action is in response to Amendment filed February 23, 2007. Claims 8-9, 14, and 28 have been cancelled as requested by Applicant. Claims 1-5, 7, 10-12, 15-24, 27, 29-33 are presented for further examination.

# Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-5, 7, 10-12, 15-21, 23, 27, 29-33 are rejected under 35 U.S.C. 102(b) as being unpatentable over Higuchi et al. (hereinafter "Higuchi", 5,774,731) in view of Chan (US Patent 6,920,454 B1).

As per claims 1, 15, Higuchi discloses in a multiprocessing computer system comprising a plurality of processing nodes interconnected through an interconnect structure, wherein the plurality of processing nodes includes a first processing node, a second processing node, and a third processing node, a method for lock request arbitration comprising:

Receiving a lock request to the second processing node from the first processing node (column 5, lines 53-58, column 6, lines 21-25, column 7, lines 34-38, column 8, lines 21-27, 44-46, 57-60, column 20, lines 17-22, 42-48, column 21, lines 15-18);

Art Unit: 2157

- Determining, at the second processing node, whether the lock request is ready for service (column 2, lines 65-67, column 3, lines 1-2, 6-10, column 6, lines 25-27, column 7, lines 36-38, column 8, lines 8-10, 21-27, 40-41, column 13, lines 1-3, column 20, lines 46-47);
- Issuing a broadcast message from the second processing node to the first and
  the third processing nodes in response to determining that the lock request is
  ready for service (column 8, lines 21-27, column 10, lines 35-50, column 20, lines
  19-22, 45-49, 55-58);
- In response to receiving the first and second probe response messages, granting lock ownership to the first processing node and transmitting from the second processing node to the first processing node a lock response message to inform the first processing node of the lock ownership (column 2, lines 65-67, column 3, lines 1-2, 6-10, column 6, lines 25-27, column 7, lines 36-38, column 8, lines 8-10, 21-27, 40-41, column 13, lines 1-3, column 20, lines 46-53).

Higuchi does not explicitly disclose:

- Receiving a first probe response at the second processing node from the first processing node in response to sending the broadcast message;
- Receiving a second probe response at the second processing node from the third processing node in response to sending the broadcast message.

However, in an analogous art, Chan discloses nodes receiving a broadcast message from a first master node. The nodes then re-map hash values and send an

Art Unit: 2157

acknowledgement to the first master node (column 6, lines 25-33, column 20, lines 18-21, 33-40, 45-49).

Therefore, one of ordinary skill in the art at the time the invention was made would have found it obvious to implement or incorporate Chan's second processing node issuing a broadcast message to first and third processing nodes and these node in response sending probing responses to the second processing node in Higuchi's system to acknowledge that the broadcast message had been received from the master node.

As per claims 2, 16, Higuchi discloses wherein determining whether the lock request is ready for service comprises:

- The second processing node placing the lock request in a queue (column 30, lines 20-30, 44-46, 63-67, column 31, lines 1-45, column 36, lines 53-58);
- The second processing node monitoring the queue to determine whether the lock request is ready for service (column 30, lines 20-30, 44-46, 63-67, column 31, lines 1-45, column 36, lines 53-58).

As per claim 3, Higuchi further discloses wherein monitoring the queue comprises:

 Sequentially processing each preceding lock request in the queue (column 30, lines 20-30, 44-46, 63-67, column 31, lines 1-45, column 36, lines 53-58).

Art Unit: 2157

As per claim 4, Higuchi discloses wherein the broadcast message informs the third processing node of servicing of the lock request (column 8, lines 21-27, column 10, lines 35-50, column 20, lines 19-22, 45-49, 55-58).

As per claims 5, 17, Higuchi discloses wherein the broadcast message includes a lock bit to inform the third processing node of the servicing of the lock request (column 11, lines 17-40, column 13, lines 28-40, column 14, lines 25-34, column 19, lines 25-40).

As per claim 7, Higuchi discloses wherein the third processing node sends the second probe response when the third processing node ceases issuance of new requests (column 30, lines 20-30, 44-46, 63-67, column 31, lines 1-45, column 36, lines 53-58).

As per claim 10, Higuchi discloses in a multiprocessing computer system comprising a plurality of processing nodes interconnected through an interconnect structure, wherein the plurality of processing nodes includes a first processing node, a second processing node, and a third processing node, a method for lock request arbitration comprising:

 The first processing node transmitting a lock release request to the second processing node (column 17, lines 10-36, column 23, lines 55-57);

Art Unit: 2157

 The second processing node issuing a broadcast message to the first and the third processing nodes in response to the lock release request (column 17, lines 10-36, column 23, lines 55-57).

Higuchi does not explicitly disclose:

 Each of the first and third processing nodes sending a first corresponding probe response message to the second processing node in response to the broadcast message.

However, in an analogous art, Chan discloses nodes receiving a broadcast message from a first master node. The nodes then re-map hash values and send an acknowledgement to the first master node (column 6, lines 25-33, column 20, lines 18-21, 33-40, 45-49).

Therefore, one of ordinary skill in the art at the time the invention was made would have found it obvious to implement or incorporate Chan's second processing node issuing a broadcast message to first and third processing nodes and these node in response sending probing responses to the second processing node in Higuchi's system to acknowledge that the broadcast message had been received from the master node.

As per claim 11, Higuchi discloses wherein the broadcast message informs the third processing node of completion of lock operations within the multiprocessing computer system (column 17, lines 10-36, column 23, lines 55-57).

Art Unit: 2157

As per claim 12, Higuchi discloses wherein the broadcast message includes a lock bit to inform the third processing node of the completion of the lock operations (column 11, lines 17-40, column 13, lines 28-40, column 14, lines 25-34, column 17, lines 10-36, column 19, lines 25-40, column 23, lines 55-57).

As per claim 18, Higuchi discloses wherein the interconnect structure includes a plurality of dual-unidirectional links (column 5, lines 25-45).

As per claim 19, Higuchi discloses wherein each dual-unidirectional link in the plurality of dual-unidirectional links interconnects a respective pair of processing nodes from the plurality of processing nodes (column 5, lines 25-45).

As per claim 20, Higuchi discloses wherein each dual-unidirectional link in the plurality of dual-unidirectional links performs packet zed information transfer (column 5, lines 25-45).

As per claim 21, Higuchi discloses wherein each of the plurality of processing nodes includes:

• A plurality of circuit elements comprising:

A processor core (column 7, lines 14-35);

A cache memory (column 7, lines 14-35);

A memory controller (column 7, lines 14-35);

Art Unit: 2157

A plurality of interface ports, wherein each of the plurality of circuit elements is coupled to at least one of the plurality of interface ports (column 7, lines 14-35, column 9, lines 12-30).

As per claim 23, Higuchi discloses wherein at least one of the plurality of interface ports in the each of the plurality of processing nodes is connected to a corresponding one of the plurality of dual-unidirectional links (column 7, lines 14-35, column 9, lines 12-30).

As per claim 27, Higuchi discloses wherein the second processing node is further configured to cease issuance of new requests and to transmit the corresponding first probe response message upon the cessation of the issuance (column 30, lines 20-30, 44-46, 63-67, column 31, lines 1-45, column 36, lines 53-58).

As per claim 29, Higuchi discloses wherein the first processing node is configured to commence the execution of the lock operation after receiving the first target done message, and wherein the first processing node is further configured to transmit a lock release request to the third processing node after completion of the execution of the lock operation (column 17, lines 10-36, column 23, lines 55-57).

As per claim 30, Higuchi discloses wherein the third processing node is configured to transmit a second broadcast message to the first and the second

**Art Unit: 2157** 

processing nodes in response to receiving the lock release request (column 17, lines 10-36, column 23, lines 55-57).

As per claim 31, Higuchi discloses wherein each of the first and the second processing nodes is configured to transmit a corresponding second probe response message to the third processing node in response to the second broadcast message (column 3, lines 12-17, column 8, lines 38-41, column 23, lines 16-20).

As per claim 32, Higuchi discloses wherein the third processing node is configured to transmit a second target done message to the first processing node in response to receiving the corresponding second probe response messages from the first and the second processing nodes (column 17, lines 10-36, column 23, lines 55-57).

As per claim 33, Higuchi discloses wherein the third processing node is configured to place a pending lock request into service upon transmission of the second target done message, and the pending lock request is generated by one of the plurality of processing nodes and is stored within the third processing node (column 2, lines 65-67, column 3, lines 1-2, 6-10, column 6, lines 25-27, column 7, lines 36-38, column 8, lines 8-10, 21-27, 40-41, column 13, lines 1-3, column 20, lines 46-47).

3. Claims 22 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable

Art Unit: 2157

over Higuchi et al. (hereinafter "Higuchi", 5,774,731) in view of Chan (US Patent 6,920,454 B1) and in further view of Shrivastava et al. (hereinafter "Shriva", 6,163,855)

As per claim 22, Higuchi, in view of Chan, does not explicitly disclose wherein the plurality of circuit elements further includes:

- A bus bridge;
- A graphics logic;
- A bus controller;
- A peripheral device controller.

However, the advantages and use for such circuit elements is well known to one skilled in the relevant art at the time the invention was made as evidenced by Shriva (column 3, lines 12-45).

Therefore, one of ordinary skill in the art at the time the invention was made would have found it obvious to implement or incorporate these elements in Higuchi in order to receive information about what device has control of the lock.

As per claim 24, Higuchi, in view of Chan, does not explicitly disclose the multiprocessing computer system comprising:

 A plurality of memory buses, wherein each of the plurality of system memories is coupled to a corresponding one of the plurality of system buses.

However, the advantages and use for such memory buses is well known to one skilled in the relevant art at the time the invention was made as evidenced by Shriva (column 3, lines 12-45).

Art Unit: 2157

Therefore, one of ordinary skill in the art at the time the invention was made would have found it obvious to implement or incorporate memory buses in Higuchi in order to receive information about what device has control of the lock.

### Response to Arguments

## The Office notes the following argument(s):

- (a) Higuchi and Chan fail to teach "receiving a first probe response at the second processing node from the first processing node".
- (b) Higuchi and Chan fail to disclose "receiving a second probe response at the second processing node".
- (c) Higuchi and Chan fail to teach "in response to receiving the first and second probe response messages, granting lock ownership to the first processing node and transmitting from the second processing node to the first processing node a lock response message to inform the first processing node of the lock ownership".

# In response to:

- (a)-(b) Chan teaches the master node (second processing node) sending a broadcast message to all nodes in the cluster. In response to the message sent, the receiving nodes (first and third nodes) send acknowledgement responses to the master node (second processing node). The nodes subsequently sends lock requests to the master node (column 6, lines 25-35, column 20, lines 33-40, 44-48).
- (c) Higuchi teaches granting exclusive use to a requesting node. A "lock grant" is sent to the requesting node that received the lock right and a "lock rejection" is sent to

Art Unit: 2157

other requesting nodes (column 3, lines 5-10, column 6, lines 42-46, column 8, lines 48-60).

Therefore, Higuchi discloses granting lock ownership to the first processing node and transmitting from the second processing node to the first processing node a lock response message to inform the first processing node of the lock ownership.

#### Conclusion

4. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Barbara N. Burgess whose telephone number is (571) 272-3996. The examiner can normally be reached on M-F (8:00am-4:00pm).

**Art Unit: 2157** 

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ario Ettinene can be reached on (571) 272-4001. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
